

COUNTER® 20G INSECTICIDE/NEMATICIDE DELIVERS “THE TASTE OF DEFEAT” TO CORN ROOTWORM AND OTHER SOIL PESTS TO MAXIMIZE YIELD RESULTS.

Get improved protection over traits alone:

Regardless of the hybrids you choose for your fields, **COUNTER® 20G** provides superior control to protect your corn seed investment. Get improved consistency in rootworm control with an in-furrow application of **COUNTER 20G** to provide the best growing environment for your crop. Heavy pressure, expanding field-evolved resistance to all commercially available Bt traits, and rotational rootworm variants in first year corn can result in root feeding and lodged corn—which can limit yields and slow you down at harvest. The proven performance of **COUNTER 20G**, provides protection against all corn rootworm species plus seed- and seedling-attacking pests.

Seed treatments do not provide complete rootworm control, and traits do not control seed-attacking pests. COUNTER 20G controls both.

Crops: Field corn, field corn grown for seed, popcorn and sweet corn

Rates: 6 oz per 1,000 ft of row

Row Spacing: 30 in

Pounds per Acre: 6.5

Get the proven performance of COUNTER 20G in-furrow:

- Control all species of corn rootworm (northern, western, southern and Mexican — including rotational variants of key species)
- Control seed- and seedling-attacking pests including wireworm, white grub, seedcorn maggot and grape colaspis
- In-furrow insect control helps produce healthier roots and stronger stands
- **COUNTER 20G** will reduce root lodging from corn rootworm for more efficient harvests and higher returns

COUNTER 20G followed by Impact® Herbicide

Use these outstanding products to deliver premium insect and weed control without interaction to maximize yield potential. Select herbicides, such as mesotrione and ALS inhibitors, are known to interact with Counter 20G.

Impact at 2 fl oz/A postemergence to corn treated with Counter 20G in-furrow at planting.

Mesotrione 4SC at 6 fl oz/A postemergence to corn treated with Counter 20G in-furrow at planting.

THE PROVEN WAY TO MAXIMIZE NEMATODE CONTROL AND IMPROVE YIELD RESULTS.

Nematodes Cost Growers Over \$10 Million Per Year

Easily misdiagnosed as weather stress, nutrient deficiencies, injury from other pests or soil compaction, nematode infestations have become a common event – and cause major yield losses in corn annually.

Because of less tillage, more continuous corn and less soil insecticide use – nematode populations are booming. Nematode feeding not only sucks precious nutrients from your corn, the tissue damage exposes plants to diseases and other pest infestations which intensifies yield losses.

Get Proactive to Protect Your Corn Fields From Nematodes

- Sample to confirm and identify corn-attacking nematodes.
- Choose hybrids with strong root vigor.
- Protect corn yields with an at-plant application of **COUNTER® 20G Insecticide/Nematicide**.

Proven Nematode Control

COUNTER 20G is proven to control nematodes. Its systemic control reaches well beyond seed treatments to stop pests before they strike roots and cut yields.

COUNTER 20G is the solution for lesion, spiral, sting, stubby-root, root-knot, dagger, lance and stunt nematodes in your corn acres.

The uncompromising power of **COUNTER 20G** also provides your trait hybrids and conventional corn superior protection from rootworms and seed-attacking pests such as wireworms and seedcorn maggots.

- Translocates throughout the corn plant from roots to stems.
- Works in a wide range of soil textures.
- Protects against nematodes with lethal control.
- Systemic activity provides protection against seed- and seedling-attacking pests.

Nematode stunting damage to untreated corn, middle 12 rows, versus Counter 20G treated corn on the left and right in a Tuckerman, AR field. Right photo, untreated (L) vs. Counter 20G treated (R) plants.

COUNTER 20G is available in Lock'N Load®, SmartBox® and SIMPAS™ SmartCartridge™ containers.
