

# PROVEN PROTECTION BEYOND TRAITS

- Proven, reliable performance to control corn rootworm larvae (CRW), seed- and seedling-attacking pests
- Better root protection, harvestability and control of pests than seed treatments or Bt rootworm traits alone
- SIMPAS® application system provides rate flexibility and control by management zone
- Focus on areas where ROI is highest (highest yielding zones, corn-on-corn, no Bt trait or single below-ground CRW trait, 1st year corn in extended diapause and western CRW variant areas)

## RECOMMENDATION

- Full rate on all corn-on-corn acres, highest yielding management zones, fields with single below-ground rootworm trait or suspected resistance to dual Bt traits
- Target seed- and seedling attacking pests and trouble zones – heavy manure, prior year weed infestations in corn-on-corn or corn-soy rotation where CRW is not a primary target
- 1st year corn (extended diapause geographies, western CRW variant in areas where soybean had ragweed, waterhemp, grass weeds or volunteer corn, and highest yield potential zones)

## AZTEC® HC INSECTICIDE HAS PROVEN ITS VALUE IN UNIVERSITY AND ON-FARM TRIALS

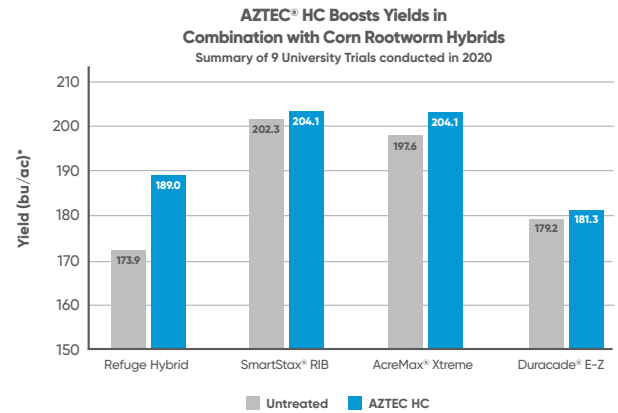

To demonstrate the enhanced yield response that **AZTEC® HC** produces in conventional and traited corn, AMVAC® sponsored academic trials across the Midwest for several years. The trials featured **AZTEC HC** on rootworm trait hybrids (both single and dual mode of action traits) and untreated refuge hybrids. **AZTEC HC** provided greater percent consistency of root protection across trials for each hybrid platform and increased yields across trials in each of the hybrid platforms evaluated.

Western corn rootworm field-evolved resistance has been documented in all commercially available Bt traits. Resistance of northern corn rootworm to two commercial Bt proteins was recently reported by North Dakota State University.\*

Get the Convenience and Proven Performance of **AZTEC HC**:

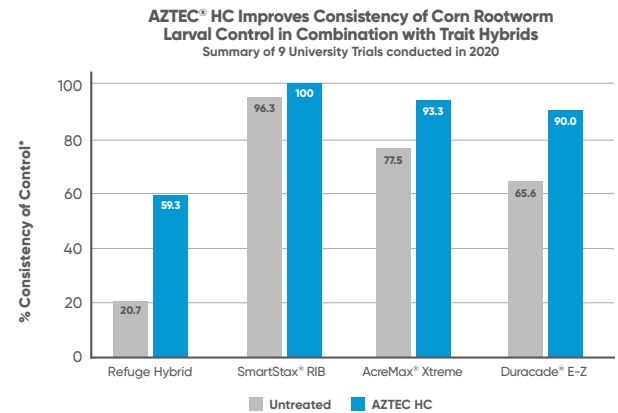

- Control all species of corn rootworms (northern, western, southern, Mexican), including rotation-resistant variants of northern and western corn rootworms
- Control seed- and seedling-attacking pests, including cutworm, seedcorn beetle, seedcorn maggot, wireworm and white grub
- In-furrow application of **AZTEC HC** produces healthier roots and stronger stands, resulting in greater harvest efficiency and higher returns

\*Calles-Torez V, Knodel JJ, Boetel MA, et al. Field-evolved resistance of northern and western corn rootworm (coleoptera: chrysomelidae) populations to corn hybrids expressing single and pyramided Cry3Bb1 and Cry34/35Ab1 Bt proteins in North Dakota. *J Econ Entomol.* 2019;112(4):1875-1886.

**Corn Hybrid Platforms – AZTEC HC vs. Untreated**

\*Yields adjusted to 15% moisture. Hybrids evaluated across trials include Refuge (no rootworm trait), SmartStax® RIB Complete®, Optimum® AcreMax® Xtreme and Agrisure Duracade® E-Z Refuge.

**Corn Hybrid Platforms – AZTEC HC vs. Untreated**

\*Percent consistency of rootworm control equals percent of roots sustaining ≤ 0.25 node-injury (NI) on 0-3 NI scale. Hybrids evaluated across trials include Refuge (no rootworm trait), SmartStax® RIB Complete®, Optimum® AcreMax® Xtreme and Agrisure Duracade® E-Z Refuge.

**AZTEC HC applied in-furrow (left) vs. untreated check on non-rootworm trait hybrid (right). 2019 SD trial.**
